Remote data workflows

Choices:

1. “download”,
2. work remotely, or
3. selective access

Download and work locally

- If you can do this still, you're lucky!
- Might happen if you need only a portion of the full data set and the organization of the data allows a simple download

Keep data remote

Techniques: ssh/X or remote visualization tools like VisIt

- might not have ssh access to server
- VisIt requires user-level backend to be running on server (at NERSC requires use of interactive queue, so a wait)

Access select data

- Data might not be organized in the manner best suited for your analysis
- Great mode for data centers: the organization of the data can't be optimized for everyone's purposes

IDL (Interactive Data Language)

- Interpreted, array based
- Easy to use for scientists
- Used heavily in earth sciences, astronomy, and other image based analysis
- Basic networking capabilities
- GDL (open source version)

Data Access Protocol (DAP)

- Lightweight, HTTP based web service
- Support for extracting portions of file
- Many server implementations (Hyrax from OPeNDAP, PyDAP, THREDDS Data Server (TDS) from Unidata, and GrADS Data Server (GDS) from COLA)
- Clients for many languages/environments (C, C++, Python, GrADS, Matlab, IDL, Ferret, IDV, McIDAS-V, and Panoply)

OPeNDAP IDL bindings

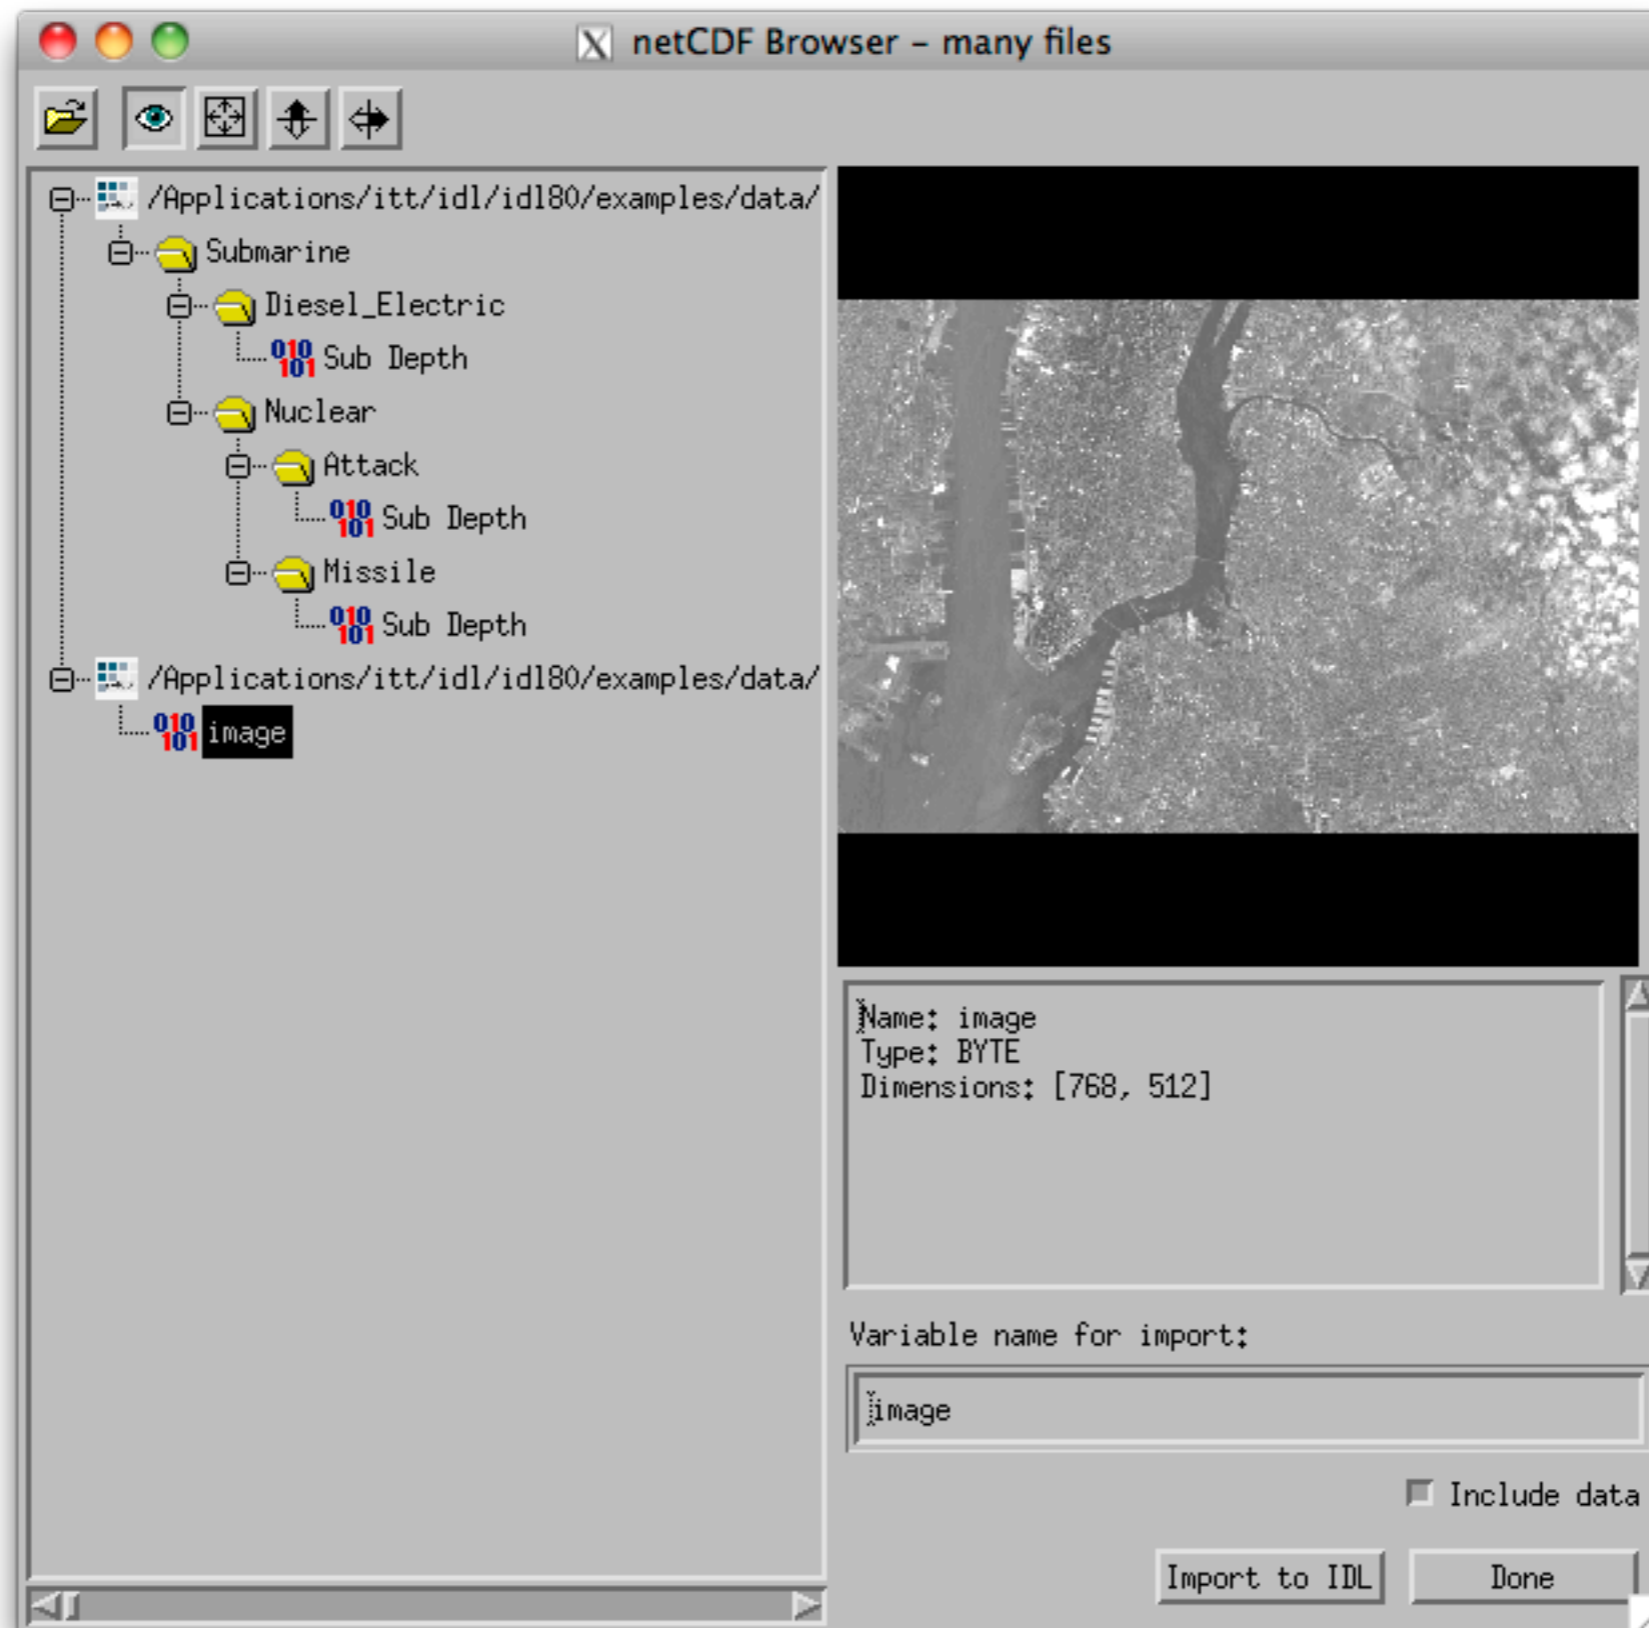

- Provided by OPeNDAP (opendap.org)
- IDL bindings incomplete
- Difficult to install for novices or on older systems

TxDAP IDL bindings

- More complete support of DAP standard
- Pure IDL (easy installation)
- Documentation
- Superset of OPeNDAP bindings
- Collaboration with ITT VIS to add operator overloading

netCDF bindings

- netCDF 4+ library works with local netCDF files and DAP URLs
- A low-level interface is provided with IDL 8.0+
- We provide high-level routines with graphical browser

Server-side functions

- Useful for reduction operations, including visualization
- OPeNDAP Hyrax server

Overview

The IDL source code for the RDL project. See the [TxDAP introduction](#) for more information about using the TxDAP bindings.

Directories

lib/	helper routines
netcdf/	routines/classes for accessing netCDF files and DAP data sets
txdap/	code for pure IDL DAP implementation
txdap/varobjects/	data objects for TxDAP
xdap/	GUI for exploring DAP servers

Project statistics

Directories:	5
.pro files:	48
.sav files:	0
Routines:	439
Lines:	10,378
Required IDL version:	6.4
